

# Status of AIRS at ECMWF

## ECMWF AIRS team changes:

- Tony McNally
- Andrew Collard (new ex *UK*)
- Thomas Auligne (new ex *Meteo France*)
- Richard Engelen
- Marco Matricardi

- 
- Phil Watts
  - Jonathon Smith
  - Frederic Chevallier

# Status of AIRS NWP impact

- Day 1 scheme implemented in operations **October 2003** (pre-operational trials suggested neutral to slightly positive impact over 100 cases)

## Post-operational trial:

AIRS impact from **70 cases of 28R1** for 500hPa geopotential Northern Hemisphere (top two lines) and Southern Hemisphere (bottom two lines).  
Period tested:  
20040301 to 20040509  
(*nb. NOAA-17 loss and new humidity analysis*)

# Development topics

- Complete diagnosis of single instrument experiments
- Study modification of observation error covariance (O)
- Further study of de-noised Principal Component (PC) data
- Improve bias correction
- Study introduction of cloud contaminated / cleared radiances
- Develop advanced sounder radiative transfer model (RTM)
- Complete CO<sub>2</sub> production (COCO) and prepare GEMS
- Implement already tested elements (cloud detection / emissivity)

# Understanding single instrument experiments (1)

Anomaly correlation of 500hPa height for the **Southern Hemisphere**  
(average of 50 cases summer and winter 2003 verified with OPS analyses)

**AIRS out performs any other single instrument forecast impact**

# But why ? ... analysis increments ...

RMS temperature increments at model level 36 (approximately 400hPa)  
averaged over 26 days (June 2003)

**No radiance** assimilation (NORAD) increments

**AIRS** only assimilation **minus NORAD** increments

**AMSUA** only assimilation **minus NORAD** increments

**HIRS** only assimilation **minus NORAD** increments

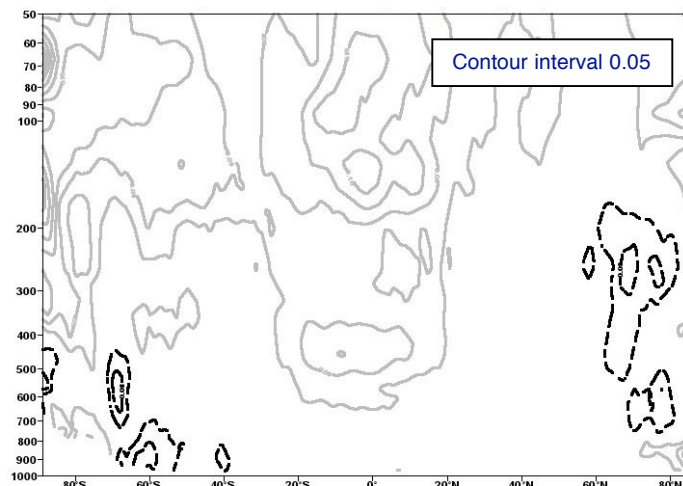

# Vertical structure of analysis increments ...

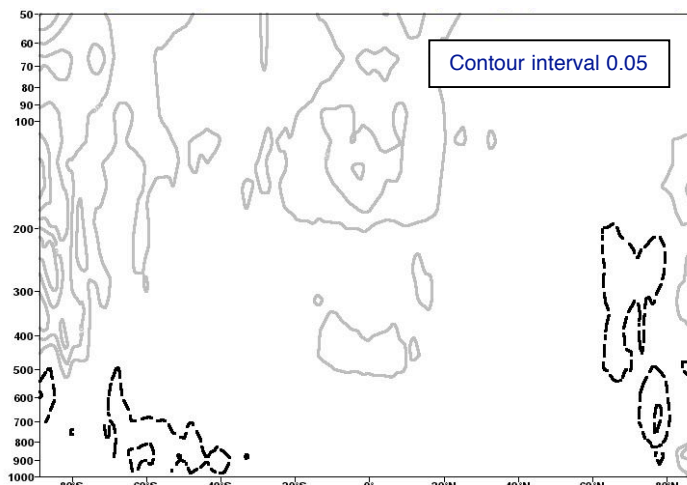

**No radiance** assimilation (NORAD) increments

**AIRS** only assimilation **minus** NORAD increments

**AMSUA** only assimilation **minus** NORAD increments

**HIRS** only assimilation **minus** NORAD increments

**The size and vertical structure of increments is higher with AIRS ...**

# Development topics

- Complete diagnosis of single instrument experiments
- Study modification of observation error covariance (O)
- Further study of de-noised Principal Component (PC) data
- Improve bias correction
- Study introduction of cloud contaminated / cleared radiances
- Develop advanced sounder radiative transfer model (RTM)
- Complete CO<sub>2</sub> production (COCO) and prepare GEMS
- Implement already tested elements (cloud detection / emissivity)

# Motivation for Observation error Study

## Observed minus calculated radiance statistics for AIRS water vapour band

So should we set the observation error to low values ?

## Experiments with different (diagonal) Observation Error

### Analysis fit to NOAA-16 AMSU-B data

# Estimating AIRS observation error

## Contributing elements ...

- Fast model error
- LBL error
- Instrument noise
- Non-linearity error
- Non-Representativeness error

But uncorrected **biases** and poorly modelled **correlations** may prevent the use of “correct” observation error

# Development topics

- Complete diagnosis of single instrument experiments
- Study modification of observation error covariance (O)
- Further study of de-noised Principal Component (PC) data
- Improve bias correction
- Study introduction of cloud contaminated / cleared radiances
- Develop advanced sounder radiative transfer model (RTM)
- Complete CO<sub>2</sub> production (COCO) and prepare GEMS
- Implement already tested elements (cloud detection / emissivity)

# De-noising with 200 NESDIS principal components

The PC de-noising does not significantly influence the filtering used to reduce noise during the cloud detection process

# Development topics

- Complete diagnosis of single instrument experiments
- Study modification of observation error covariance (O)
- Further study of de-noised Principal Component (PC) data
- Improve bias correction
- Study introduction of cloud contaminated / cleared radiances
- Develop advanced sounder radiative transfer model (RTM)
- Complete CO<sub>2</sub> production (COCO) and prepare GEMS
- Implement already tested elements (cloud detection / emissivity)

# Use of the gamma bias correction for AIRS

STATISTICS FOR RADIANCES FROM AQUA / AIRS  
BIAS CORR. ZONAL MEAN FIRST GUESS DEPARTURE (OBS-FG) [ K ] ( AÓ

CHANNEL = 221

EXP = 0001

- Implement already tested elements (cloud detection / emissivity)

# RTIASI version 5

## New Features:

- ❑ Multiple scattering by aerosols and clouds  
(11 aerosol components, 5 types of water clouds and 8 types of ice clouds)
- ❑ Treatment of heterogeneous cloud cover  
(weighted average of elemental overcast columns)
- ❑ Improved integration accuracy for optically thick layers  
(new linear in  $\tau$  parameterization of the Planck function)

Over the next 6 months RTIASI will be formally merged with RTTOV and then the science will be tested using real AIRS radiance data

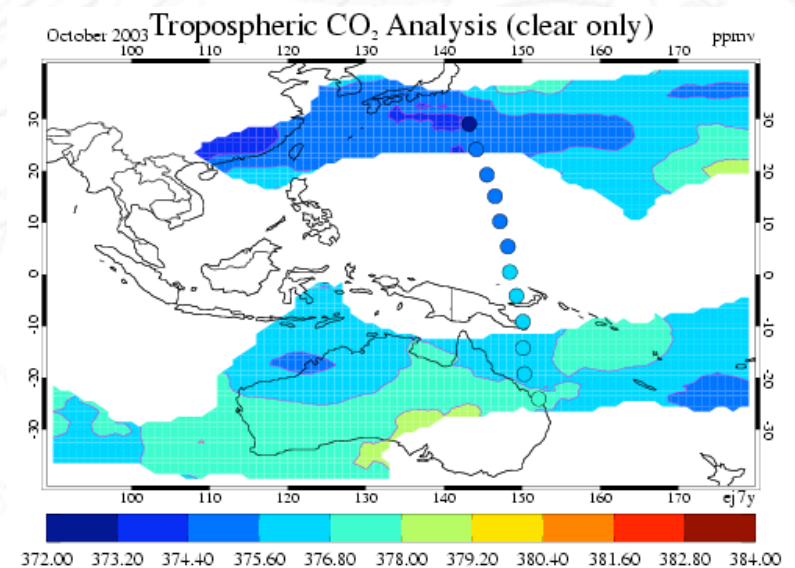

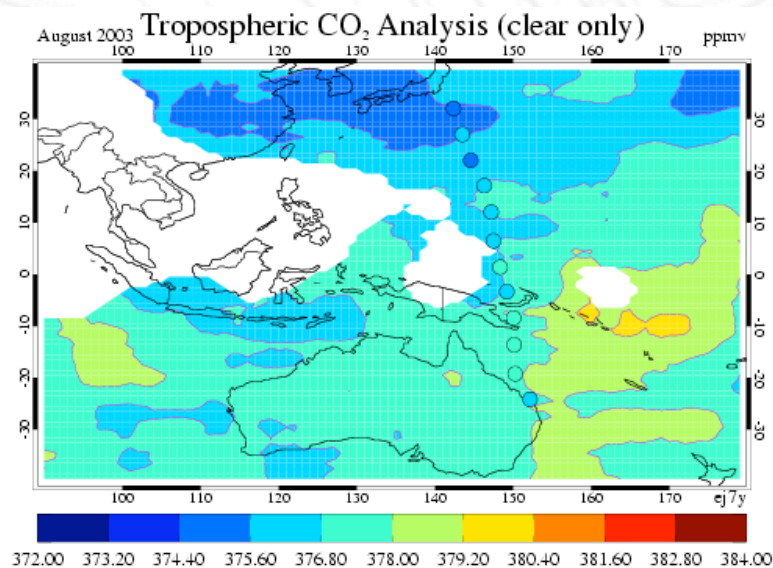

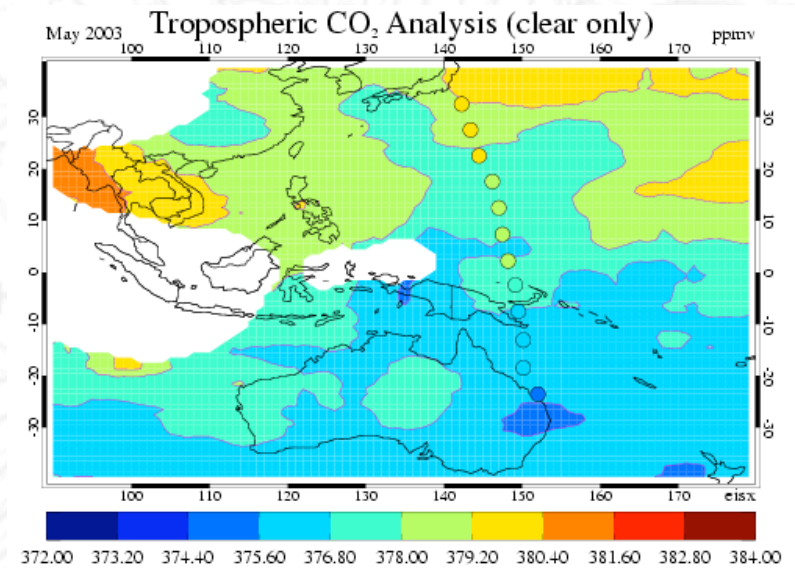

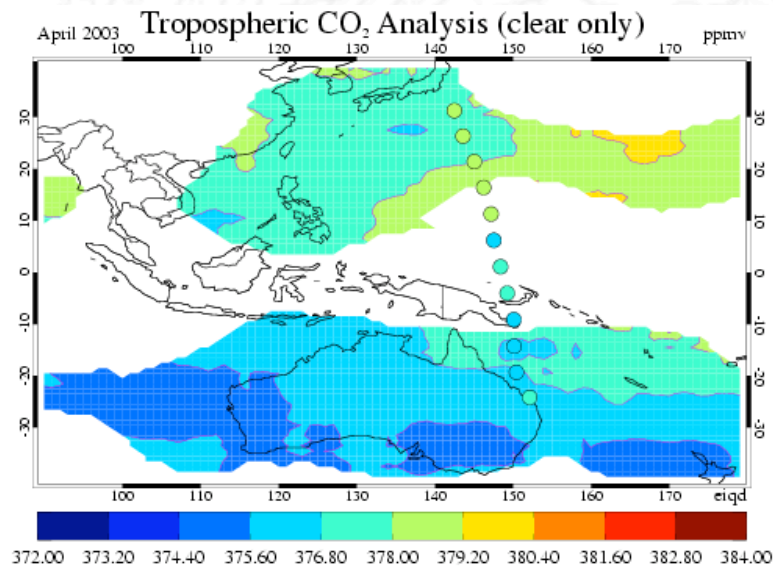

# Development topics

- Complete diagnosis of single instrument experiments
- Study modification of observation error covariance (O)
- Further study of de-noised Principal Component (PC) data
- Improve bias correction
- Study introduction of cloud contaminated / cleared radiances
- Develop advanced sounder radiative transfer model (RTM)
- Complete CO<sub>2</sub> production (COCO) and prepare GEMS
- Implement already tested elements (cloud detection / emissivity)

# CO<sub>2</sub> Assimilation - Validation
